The way to solve a complex problem is to break it down into a series of simpler problems. Be careful not to lose sight of your goal among all the bits and pieces, however. Before beginning plot your course. In this case we'll start by finding the effective resistance of the entire circuit and the current from the battery.

When you're building a complex circuit that includes bridges or T networks, then you can't solely rely on Ohm's Law to find the voltage or current. This is where Kirchhoff's Circuit Law comes in handy, which allows you to calculate both the current and voltage for complex circuits with a system of linear equations.

A German Physicist "Robert Kirchhoff" introduced two important electrical laws in 1847 by which, we can easily find the equivalent resistance of a complex network and flowing currents in different conductors. Both AC and DC circuits can be solved and simplified by using these simple laws which is known as Kirchhoff's Current Law (KCL) and Kirchhoff's Voltage Law (KVL).

Series and parallel combinations One of the simplest and most useful things we can do in a circuit is to reduce the complexity by combining similar elements that have series or parallel connections. Resistors, voltage sources, and current sources can all be combined and replaced with equivalents in the right circumstances. We start with resistors.

The short-circuit condition illustrated in figure 9 effectively reduces  $I_2$  and  $I_3$  to zero and increases the supply current to  $I = \frac{E}{R_1}$ . Obviously, the current through  $R_1$  is now greater than normal, and again power dissipation might present a problem. Fig.9: Short-Circuit Across Resistor  $R_3$ .
