The WHO Guidelines on Hand Hygiene in Health Care provide health-care workers (HCWs), hospital administrators and health authorities with a thorough review of evidence on hand hygiene in health care and specific recommendations to improve practices and reduce transmission of pathogenic microorganisms to patients and HCWs. The present Guidelines are intended to be implemented in any situation in which health care is delivered either to a patient or to a specific group in a population. Therefore, this concept applies to all settings where health care is permanently or occasionally performed, such as home care by birth attendants. Definitions of

health-care settings are proposed in Appendix 1. These Guidelines and the associated WHO Multimodal Hand Hygiene Improvement Strategy and an Implementation Toolkit

(<http://www.who.int/gpsc/en/>) are designed to offer health-care facilities in Member States a conceptual framework and practical tools for the application of recommendations in practice at the bedside. While ensuring consistency with the Guidelines recommendations, individual adaptation according to local regulations, settings, needs, and resources is desirable. This extensive review includes in one document sufficient technical information to support training materials and help plan implementation strategies. The document comprises six parts.

The pharmaceutical industry has long and vehemently insisted that it has the willingness, the dedication, and the ability to police itself to insure that the public will not be unnecessarily harmed or defrauded. As the record shows with painful clarity, however, virtually no industry or professional group has ever adequately

policed itself, and the pharmaceutical industry is no exception. Where the most flagrant abuses have been exposed and corrected, major credit must probably be divided among the media that publicized the situation, consumer groups that applied pressure, government officials who took actions that were often unpopular, and individual members of the pharmaceutical industry who had the courage to face up to their social responsibilities. In this book, the authors turn their attention to what happened in Third World countries when, because of worldwide pressures, the multinational drug companies largely corrected their notorious abuses. On the basis of painstaking research, much of it conducted in a great many Third World countries, the authors conclude that a plethora of small local firms have filled the dishonest sales channels vacated by the multinationals. The authors show in great detail how local drug

firms in the Third World have taken advantage of loose regulatory practices and unscrupulous behavior on the part of regional and national health care professionals to promote the sale of dangerous or worthless drugs as remedies for diseases for which they were never intended. Warnings of bad side effects are omitted from promotional literature, drugs are sold that have not had proper trials, and drug firms have often bribed government officials, doctors, and hospital administrators in order to gain favorable treatment in the importation and sale of their products. Among the many topics treated in this book are the controversy over inexpensive generic drugs (including disclosures of fraud and bribery in the U.S. Food and Drug Administration), the actions of consumer groups, and the key role of government in preventing abuses by drug firms. The authors describe a remarkable attempt in Bangladesh, one of the

poorest of all the developing countries, to develop a high-quality local drug industry. They also present as case histories reports on three extremely important drug products or groups—the dipyrone (for control of pain and fever), high-dosage estrogen-progesterone hormone products (for use in pregnancy tests), and clioquinol or Enterovioform (for treatment of diarrhea)—all of which were or still are centers of worldwide, heated controversy.

This book contains the proceedings of the first meeting on invertebrate immunity ever sponsored as a summer research conference by the Federation of American Societies for Experimental Biology (FASEB). The conference was held in Copper Mountain, CO from July 11-16, 1999. It was an extension of a New York Academy of Sciences meeting entitled "Primordial

Immunity: Foundations for the Vertebrate Immune System" held on May 2-5,1993 at the Marine Biological Laboratories in Woods Hole, MA. The proceedings of that meeting were published in The Annals of the New York Academy of Sciences (volume 712). At that meeting all the attendees agreed that this type of conference (a relatively small focused gathering) allowed for participation by investigators at all levels of their careers. We further agreed that we should search for a forum that would allow this meeting to continue. The FASEB Summer Research Conference was an excellent vehicle for this type of meeting. Furthermore, this year's participants decided to continue this meeting as a regularly scheduled FASEB sponsored event. This was a unique conference in the sense that it focused upon mechanisms of development and defense in protostome and deuterostome invertebrates and lower vertebrates.

Edible insects have always been a part of human diets, but in some societies there remains a degree of disdain and disgust for their consumption. Insects offer a significant opportunity to merge

traditional knowledge and modern science to improve human food security worldwide. This publication describes the contribution of insects to food security and examines future prospects for raising insects at a commercial scale to improve food and feed production, diversify diets, and support livelihoods in both developing and developed countries. Edible insects are a promising alternative to the conventional production of meat, either for direct human consumption or for indirect use as feedstock. This publication will boost awareness of the many valuable roles that insects play in sustaining nature and human life, and it will stimulate debate on the expansion of the use of insects as food and feed.
