The bridge design will be basically determined by the type of bridge, such as the beam bridge or the suspension bridge. Bridge foundations have to be carefully selected and constructed since they will bear the bridge and the vehicle loads. The bridge should be able to bear the dynamic loads, especially the wind forces.

Structural engineers are highly skilled, creative professionals who design the strength and stability of our buildings and bridges.

Structural engineers help create record-breaking structures, beautiful structures, useful structures and sometimes just cool structures - anything from bridges, rollercoasters and skyscrapers to hospitals, homes and public artworks.

The prototypical bridge is quite simple—two supports holding up a beam—yet the engineering problems that must be overcome even in this simple form are inherent in every bridge: the supports must be strong enough to hold the structure up, and the span between supports must be strong enough to carry the loads. Spans are generally made as short as possible; long spans are justified where good foundations are limited—for example, over estuaries with deep water.

## Structural Engineering for Bridges - Widseth

Structural Engineering is essentially the science of anticipating how structures such as buildings and bridges will stay standing. Structural Engineers use maths, geometry and physics to make sure structures will cope with their shape, weight and materials as well as environmental factors like the weather and the ground they're built on.

Structural Engineering is a sub-discipline of civil engineering in which structural engineers are trained to design the 'bones and muscles' that create the form and shape of man-made structures. Structural engineers need to understand and calculate the stability, strength and rigidity and earthquake of built structures for buildings and nonbuilding structures. The structural designs are integrated with those of other designers such as architects and building services engineer and often supervise
